ABSTRACT

This metadata "data about data" report provides a description and discussion of the hydrologic and meteorologic data holdings maintained on the South Florida Water Management District (SFWMD) database DBHYDRO. The data holdings come from a large hydrometeorological monitoring network covering the 16 counties within the jurisdiction of the SFWMD. The data originate from the SFWMD, cooperating federal, state, and local agencies, and various other groups. The information is provided to assist users of the data with requesting and acquiring data from the database.

ACKNOWLEDGEMENTS

A great deal of thanks go to several individuals who helped in completing this publication: to Joan Stockum, Tim Scharff, and Vicky LaBelle for their work on the GIS maps found in this report; to Nagendra Khanal, Madhav Pandey, Tim Scharff, Angela Chong, Davies Mtundu, Brian Turcotte for their helpful suggestions and comments. Special thanks are due to Trevor Campbell and Robb Startzman for providing the impetus for the creation of this document.

INTRODUCTION

The South Florida Water Management District is mandated to manage the natural resources of south Florida within its 16 county jurisdictional area. To assist the primary functions associated with water quality and environmental protection and enhancement, the District maintains corporate databases for storing historic surface-water, ground-water, weather, and water quality records.

The records which are listed and described in this report are maintained in the DBHYDRO corporate database. The records represent the hydrometeorological monitoring efforts of the District, and to an extent, other cooperating Federal, State, Local, and private entities. The data is used in support of various activities such as resource evaluation, ecosystem research, basin planning activities, and information for engineering design. The data also serves as a record of operational management decisions for the Central and South Florida Flood Control Project.

The hydrometeorological monitoring network covers all or part of the 16 counties within the boundaries of the District. The data from this network include rainfall and other weather records collected throughout the District, discharge for streams, canals, and over 215 water control structures. Water level stages are also monitored at various points on streams, lakes, in coastal areas, and throughout the roughly 1500 miles of the primary canal system. There are other records which are maintained as well, and these are presented in this report. The following sections of introductory text are presented to provide users with a general explanation of what types of data are available, how the data listed in this report are organized, and how to obtain computerized listings of hydrometeorologic data from the District.

REPORT FORMAT

This report is organized by presenting record holdings information on the data from the monitoring network by county in geographic sequence from the northern section of the District to the southern portion. The information from the 16 counties is grouped into seven sections. The counties presented within each section are grouped by geographic proximity. An index map of the District showing the 16 counties is depicted in Figure 1. In this figure, the District is sectioned into 12 regions which are partioned to include as much of the monitoring network in a particular county as possible. Individual map coverages corresponding to each of the 12 regions shown in the index map (Figure 1) can be found in sections one through seven. The index map assignment for the county groups is shown in Table 1 along with the section in which the counties and maps are found.

Table 1. Geographic County Groups and Index Map Assignments

COUNTY	SECTION	INDEX MAP NO.
Orange, Osceola, Polk	1	1 - 2
Martin, St. Lucie	2	3
Glades, Highlands, Okeechobee	3	2 - 4 - 6
Charlotte, Lee, Hendry, Collier	4	5 - 8 - 9
Palm Beach	5	7
Broward	6	10
Dade, Monroe	7	11 - 12

A description of the types of data records maintained by the District along with the general classification of the data is given in Table 2. The classification system groups the data records under general headings of weather, flow, stage, or water quality. Weather records would include rainfall, evaporation, wind speed, and humidity. Flow records include discharge at water control structures, streams, and canals. Stage records include surface water levels in lakes, streams, canals and groundwater levels. Water quality records include parameters such as conductivity, water temperature, and dissolved oxygen. The most commonly encountered measurement units associated with a particular record is also shown in Table 2.

The data available for each county on the database in some cases originates from outside sources such as Federal, State or local agencies. Rainfall records for instance may originate from the National Weather Service (NOAA) or the State of Florida Forestry Service. Discharge records for certain federal public works may originate from the US Geological Survey (USGS) or the US Army Corp of Engineers (ACOE), and in some cases are obtained from local, county, or private water districts. The USGS also provides the District with ground water level data from an

extensive monitoring network covering south Florida. A current list of the contributing agencies is given in Table 3. A summary is provided in Table 4 of the total number of records currently available on the District's corporate database (DBHYDRO) and the distribution of the records among the agencies contributing data, including the District. These records will likely increase in the future as more monitoring is initiated throughout the District in support of environmental projects.

RECORD HOLDINGS INFORMATION

Data Records

Presently, there are 32 different hydrometerological types of data available on DBHYDRO originating from 19 agencies, with a majority of the data originating from the District or USGS. Additionaly, there are 19 types of water quality parameters available on the DBHYDRO database at the present time. The presentation of the water quality records information in this report is ancillary to the main intent to present information on the hydrometeorological records. At the time of compiling this report there was an effort under way to merge the main water quality corporate database with the hydrometeorologic database, and no attempt is made in this report to describe all of the water quality record holdings information currently available. The reader can find more information covering water quality records in a District publication entitled "Surface Water Quality Monitoring Network" (Germain, 1994).

There are over 3000 records maintained on the database associated with District data which cover mostly rainfall, surface water levels and discharge. Also maintained, are over 7000 records from the USGS covering for the most part, ground water levels and stage data. For the purpose of this report, a record is defined as a data type with an associated reporting frequency and a statistic type. For instance, a rainfall record would be identified as data type "rain" with a reporting frequency of "daily" or "DA" and a statistic type of "sum". A surface water level record is identified by data type "stage" or "stg" which might be associated with a "DA" or "daily" reporting interval and a "mean" statistic type. Complete records of continuous data are obtained from recording instrumentation and measuring devices for which a complete set of records for any time period can be retrieved, or from estimations. Partial records are the result of recording device malfunctions, unprocessed data, or discontinuance of collection of the data.

The scope of this report is to present metadata information about all the current DBHYDRO database records, except for the USGS information. The metadata information represents 2 classes of records; 1) records which were once collected, analyzed, and compiled by the contributing agencies, including the District, which have been discontinued, and 2) records which continue to be collected, analyzed, and compiled. Records originating from the USGS which are maintained on the database are not included in this report for 2 reasons; 1) the number of records (over 7000) is too voluminous to include, and 2) the original records are appropriately described by the USGS in yearly water resource publications for northeast and south Florida.

The geographic county groups are presented in 7 sections and correspond to the assignments shown in Table 1. Each section contains one or more index maps which cover the geographic area of the counties. The record information is presented by county in Tables 6 through 21 throughout the 7 sections. To facilitate the reader, the 12 index maps were created to present some of the more commonly used methods for locating and identifying the hydrometeorologic monitoring sites. Each map has border information including latitude-longitude and township-range coordinates to assist with locating record information in a particular geographic region. Also included are names of major lakes, primary canals and streams, and major roads. County

names and major water catchment areas are shown along with the border demarcations of these areas. The border information is provided also as a cross reference to the information in the record holdings tables (Tables 6 - 12).

Because there are over 3,770 records, excluding the USGS, it was determined that it would be impossible to show all the records in their respective location in each index map. Therefore, only active monitoring sites are shown. Active sites are determined to be sites which have records that have continued to be collected after January 1, 1995. An active site can include the monitoring of a number of data types, with each data type contributing one or more records to the database. For instance, an active site at a water control structure would include headwater and tailwater stage data types, which in turn could contribute a min, max, or mean daily headwater or tailwater record to the database. Since the index maps include coordinate information, the undisplayed records can be located by roughly matching the coordinates in the tables against the maps. Also, the maps were created to the same scale to enable the user to cut and paste together a larger composite map of the geographic areas and counties.

Record Presentation

Each record table corresponding to the 16 counties contains the following information: DBHYDRO station name, ARCHIVE station name, dbkey, section-township-range (SETNRG), latitude and longitude, station description, data type, reporting frequency, statistic type, agency, start and end date of record (POR), county abbreviation, and District hydrologic basin area name. The DBHYDRO station name and dbkey number identify the record for which summary data has been compiled, such as, mean daily flow, mean or max or min daily stage, or daily rainfall sum. The ARCHIVE station name identifies the raw data record which was collected, analyzed, and compiled to produce the summary data record on DBHYDRO known by the DBHYDRO station name. Some DBHYDRO records do not have an associated source record identified by the ARCHIVE station name, only a DBHYDRO station name. This usually occurs when the data record originates from an outside agency which has analyzed and precompiled the summary record, and in turn the summary record was loaded to DBHYDRO. Hydrologic basin names given in the tables coincide with basins depicted in Figure 2.

Station Names and Reference Numbers

Each record shown in Tables 6 through 21 is identified by a station name and a unique alphanumeric reference number (dbkey). The station name is generally assigned to coincide with the location of the recording device at a particular site. For instance, a stage record which is compiled from a recording device located on the headwater side at the site of a water control structure called S65E might be called "S65E_H". The dbkey number is established when the record is registered for the first time on the database. The records for each unique dbkey number are maintained for an indefinite period of time. Monitoring stations at a particular site can have one or several measuring devices recording a variety of data types, and each individual data type based on the reporting frequency and statistic type is assigned a unique dbkey. A list of common parameter designators for data types collected at a monitoring station is shown in Table 5.

This Page Left Intentionally Blank

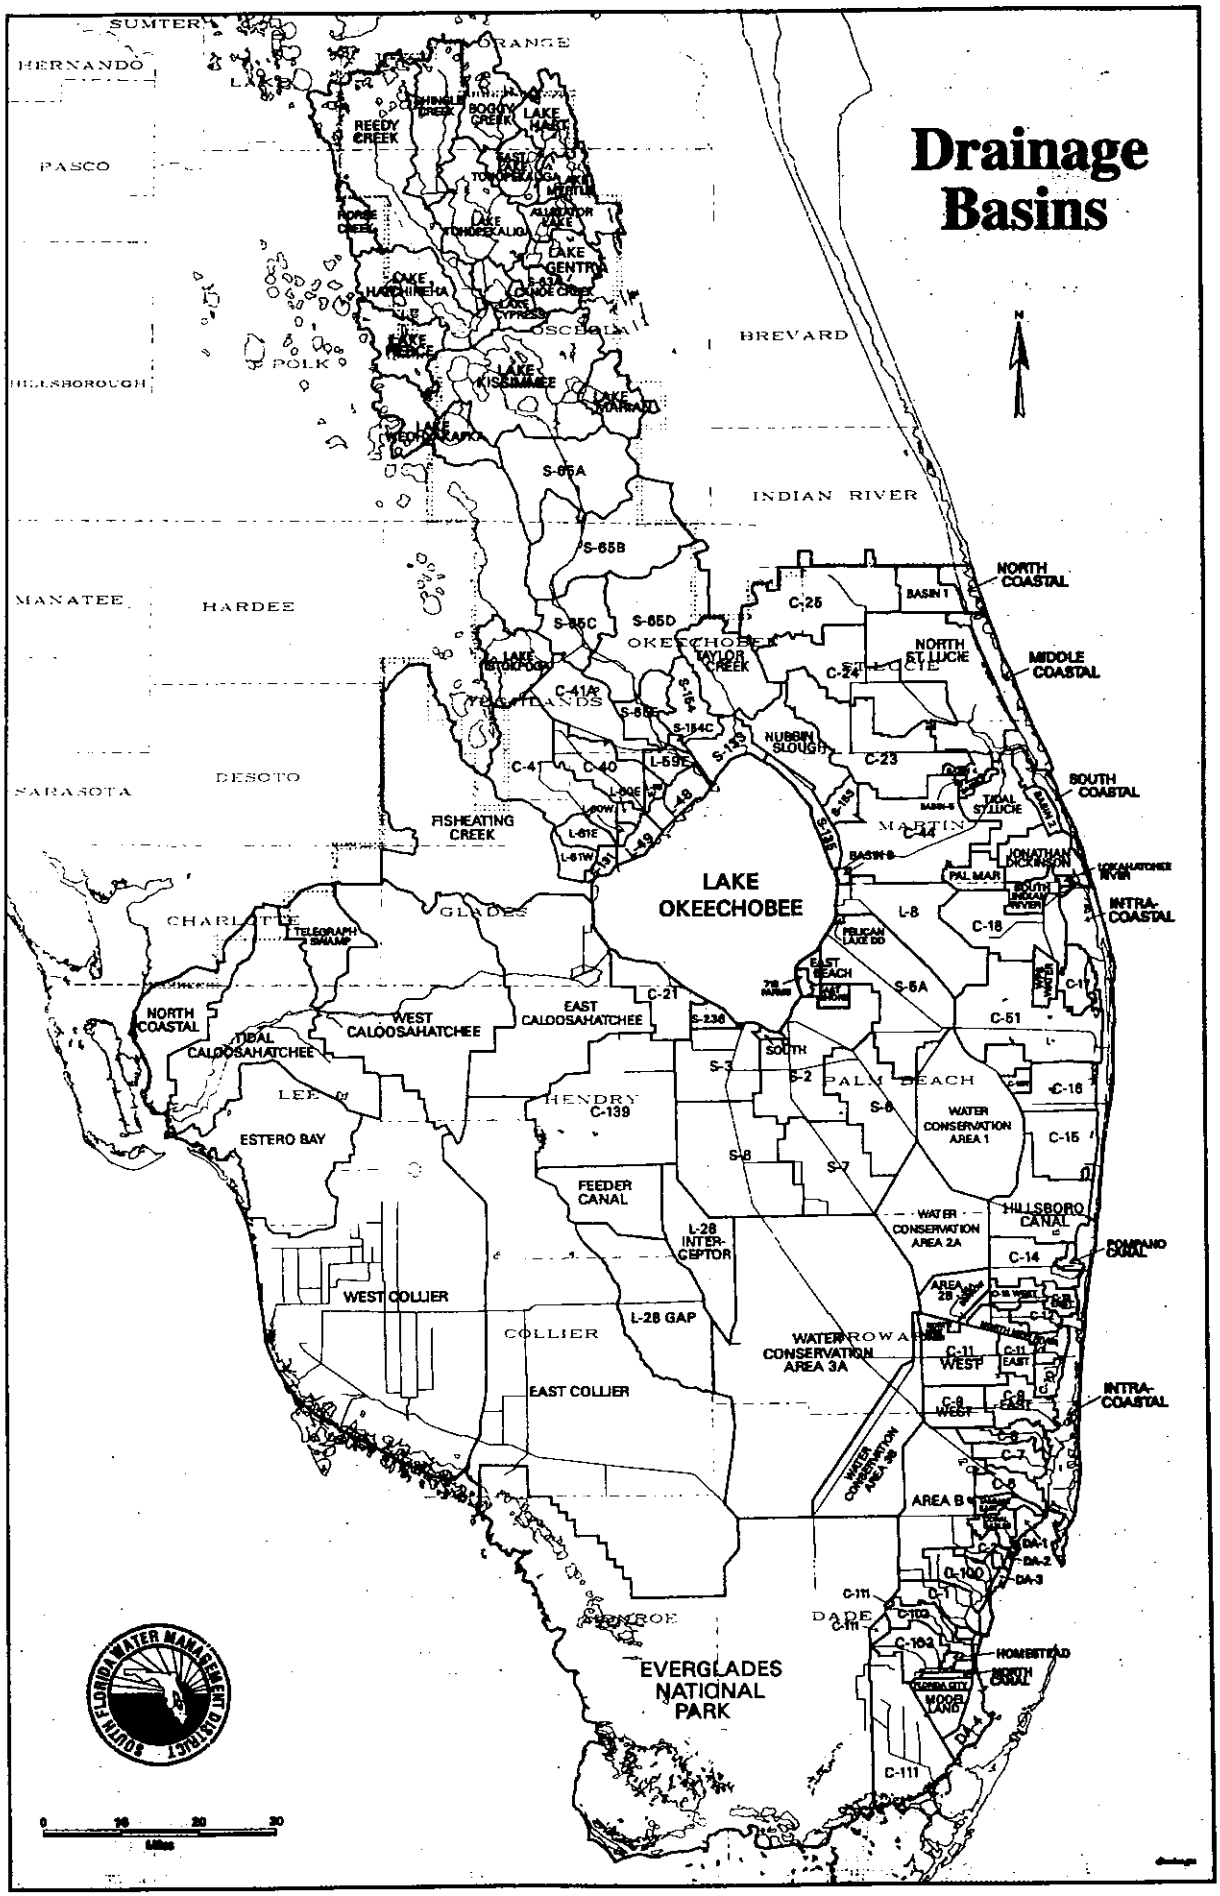

Figure 2. Drainage Basin Delineation for the South Florida Water Management District.

These parameter designators are usually made part of the ARCHIVE station name. The assignment of the dbkey numbers is based on a five character alphanumeric numbering system. New dbkeys for a particular data type can emerge from time to time as a result of changing or modernizing the recording instrumentation or by adding, for instance, a "MAX" or "MIN" statistic type which creates a new record. As new technologies replace older instrumentation, such as analog recorders that trace continuous graphs of stage or digital punch tapes that punch stage or rain values at selected time intervals, with solid state devices and telemetry systems, the practice is to assign a new unique dbkey to the data types from the new recording instruments.

Table 5. List of Parameter Designators for Data Types

PARAMETER DESIGNATOR	PARAMETER DESCRIPTION - INSTRUMENT TYPE
@H, +H, *H, -H	Headwater Stage - DWR, Solid State, Graphic, Telemetry
@T, +T, *T, -T	Tailwater Stage - DWR, Solid State, Graphic, Telemetry
@1, +1, *1, -1	Gate Operation - Manual Log, Solid State, Graphic, Telemetry
@P1, +P1, -P1	Pump Operation - Manual Log, Solid State, Telemetry
@R, +R, -R	Rainfall - DWR, Solid State, Telemetry
+V	Velocity - Solid State
+C, -C1, -C2, -C3	Conductivity - Solid State, Telemetry
+PH	PH - Solid State
+O	ORP - Solid Satte
+DO	Dissolved Oxygen (DO) - Solid State
+RN	Net Solar Radiation - Solid State
+RT	Radiation Total (Note: RT sometimes refers to Rainfall Total)
+RP	Photoactive Radiation (Quantum)- Solid Satte
+RH	Relative Humidity - Solid State
+L	Lock Gate - Solid State
+AT, +AP	Air Temerature, Barometric Pressure - Solid State
+TO, +T1, +T2	Upper, Middle, and Lower Water Column Temparatures - Solid State
+TG	Total Gallons Pumped - Solid State
+SP	Sample Count - Solid State
+LW	Leaf Wetness - Solid State
+Q	Discharge - Solid State
+	Stage - Solid State

DATASET ACCESS AND AVAILABILITY

All of the hydrometeorological and water quality datasets described herein are available for distribution to the public. Information and data can be obtained either by sending a written request to the District or through remote on-line electronic access to the District hydrometeorological DBHYDRO database. Data can be obtained in several different types of formats depending on the intended use by the recipient. Datasets can be formatted in a tabular layout for inclusion in reports and documents, or in columnar formats suitable for import into popular spreadsheet programs.

It should be noted that the DBHYDRO database does not contain every record produced from the various types of monitoring efforts conducted by the contributing agencies. The reader may wish to check with the other agencies to determine if there are other records available which are not found on the DBHYDRO database.

As governed by Florida's Public Records Law, there may be in some instances a cost associated with obtaining information and data. For further information on charges associated with written requests and remote on-line database access, please refer to Rule 40E-1.125, F.A.C, or contact the District at the address given below.

Requests for District database records or for further information can be made to:

Director
Water Resources Evaluation Department
South Florida Water Management District
P.O. Box 24680
West Palm Beach, FL 33416-4680 telephone: (407) 686-8800

The following information can be included in a written request to facillitate the retrieval of the information and/or data:

1) Requestor's name, address, and phone number.
2) Station identification or area identified by any of county, lat/long, section-township-range, or District structures or canals.
3) Period of record

In some cases, more information than the above may be needed if records are difficult to identify.

ANY INFORMATION, INCLUDING BUT NOT LIMITED TO SOFTWARE AND DATA RECEIVED FROM THE SOUTH FLORIDA WATER MANAGEMENT DISTRICT ("DISTRICT") IN FULFILLMENT OF A REQUEST FOR INFORMATION IS PROVIDED "AS IS" WITHOUT WARRANTY OF ANY KIND, AND THE DISTRICT EXPRESSLY DISCLAIMS ALL EXPRESS AND IMPLIED WARRANTIES, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE DISTRICT DOES NOT WARRANT, GUARANTEE, OR MAKE ANY REPRESENTATIONS REGARDING THE USE, OR THE RESULTS OF THE USE, OF THE INFORMATION PROVIDED TO YOU BY THE DISTRICT IN TERMS OF CORRECTNESS, ACCURACY, RELIABILITY, TIMELINESS OR OTHERWISE. THE ENTIRE RISK AS TO THE RESULTS AND PERFORMANCE OF ANY INFORMATION OBTAINED FROM THE DISTRICT IS ENTIRELY ASSUMED BY THE RECIPIENT.

SECTION 1

ORANGE - OSCEOLA - POLK COUNTIES

Data Presentation

This section describes the records maintained for Orange, Osceola, and Polk counties in the northern geographic portion of the District. The counties are covered in Map Indexes 1 and 2, and the record information is shown in Tables 6, 7, and 8.

SECTION 3

GLADES - HIGHLANDS - OKEECHOBEE COUNTIES

Data Presentation

This section describes the records maintained for Glades, Highlands, and Okeechobee counties in the north central geographic portion of the District. The counties are covered in Map Indexes 2, 4, and 6, and the record information is shown in Tables 11, 12, and 13.

This Page Left Intentionally Blank

SECTION 5

PALM BEACH COUNTY

Data Presentation

This section describes the records maintained for Palm Beach county in the eastern geographic portion of the District. The county is covered in Map Index 7, and the record information is shown in Table 18.

This Page Left Intentionally Blank

SECTION 6

BROWARD COUNTY

Data Presentation

This section describes the records maintained for Broward county in the eastern geographic portion of the District. The county is covered in Map Index10, and the record information is shown in Table 19.

This Page Left Intentionally Blank

SECTION 7

DADE - MONROE COUNTIES

Data Presentation

This section describes the records maintained for dade and Monroe counties in the southern geographic portion of the District. The counties are covered in Map Indexes 11 and 12, and the record information is shown in Tables 20 and 21.

GLOSSARY

MEAN:	Average or Mean Daily Value
MIN:	Minimum Daily Value
MAX:	Maximum Daily Value
SUM:	Sum for Specified Interval
POR:	Period of Record
DBKEY:	Unique Database Identifier Key
REC:	Recorder or Instrumentation Type
FREQ, FQ:	Reporting Frequency
DA:	Daily
RI:	Random Interval or Point Value
DWR:	Daily Water Reading
BK, BKPT:	Breakpoint Data
INST:	Breakpoint Data
RI, RAND:	Random
HR:	Hourly
MO:	Monthly
LAT:	Latitude
LONG:	Longitude
SETNRG:	Section, Township, Range
CNTY:	County
AGCY:	Agency
AM:	Morning Reading
PM:	Afternoon Reading
FWM:	Flow Weighted Mean
THH:	Highest High Tide
THL:	Highest Low Tide
TLH:	Lowest High Tide
TLL:	Lowest Low Tide
ZSUM:	Vector Summation
X:	Unknown Method
BMID:	Hours Before Midnight
AMID:	Hours After Midnight
