Subsidence Post

UF UNIVERSITY of
FLORIDA
IFAS

This 9-foot concrete post was driven to bedrock. The post was set level with the soil surface.

A photograph revealed 58 inches of visible post; approximately 1 inch of subsidence per year.

The post was 72 inches above ground in March of 1967, indicating 6 feet of soil subsidence in the past 84 years.

Subsidence rates have declined from approximately 1 inch per year to approximately 1/2 inch per year. This has been partially attributed to Best Management Practices implemented by local growers.
