

MEMORANDUM

TO: Laureen Borochaner, Chief, Engineering Division (USACE)
FROM: John Mitnik, Chief District Engineer (SFWMD)
DATE: July 11, 2024
SUBJECT: Operational Position Statement, July 9, 2024 to July 15, 2024

This Position Statement is to provide operational input for the one-week period from July 9, 2024 to July 15, 2024 based on system conditions and data observed during the previous Monday to Sunday 7-day period. On July 7 the daily average Lake Okeechobee stage was 12.19 feet NAVD88 (13.50 feet NGVD29), which placed it within the Low Sub-band of the 2008 Lake Okeechobee Regulation Schedule (LORS). Lake stage increased by 0.11 feet over the preceding 14-day period.

District July rainfall to date is below normal (66% of normal). The rainfall forecast (issued July 10) calls for near normal rainfall for the coming 7-day period and uncertain for the following period.

Precipitation Outlook: The most recent CPC precipitation outlook for Jul 2024 is for increased chances (40-50%) of above Normal rainfall for the Lake Okeechobee and south, and substantial increased chances (50-60%) of above Normal rainfall for the remainder of the District. The 3-month window of Jul 2024 - Sep 2024 shows substantial increased chances (50-60%) of above Normal rainfall for south Florida. The 3-month window of Aug 2024 - Oct 2024 indicates increased chances (40-50%) of above Normal rainfall for the entire District. The transition into the 2024 – 2025 Dry Season goes through the 3-month window of Sep 2024 – Nov 2024 with equal chances of below, normal, and above normal (EC) for south Florida. The 3-month window of Oct 2024 – Dec 2024 shows increased chances (40-50%) of below normal rainfall for areas north of the EAA, and slightly increased chances (33-40%) of below normal for the respective remainder areas of the District. The 3-month windows of Nov 2024 – Jan 2025, Jan 2025 – Mar 2025 and Feb 2025 – Apr 2025 show outlooks for increased chances (40-50%) of below normal rainfall for the entire District. The 3-month window of Dec 2024 – Feb 2025 signals substantial increased chances (50-60%) of below normal rainfall for south Florida. The transition into the 2025 wet season shows equal chances (EC) of rainfall for the state of Florida.

2008 LORS Release Guidance (Part C): With Lake Okeechobee stage in the Low Sub-band, the Tributary Hydrologic Conditions in the Normal category, and the Multi-Seasonal Lake Okeechobee Net Inflow outlook in the Normal Category, Part C of the 2008 LORS suggests “Maximum Practicable Releases to the WCAs if desirable or with minimum Everglades impact; otherwise, no releases to the WCAs”.

Over the 14-day period from June 24 to July 7, 2024, no regulatory releases were sent from Lake Okeechobee south to the STAs. No lake regulatory releases reached the Lake Worth Lagoon through the C-51 canal during this period. Stage in WCA-1 is above regulation schedule. Stage in WCA-2A is above regulation schedule. WCA-3A stage is above regulation schedule. For the coming operational period, USACE is not requesting maximum practicable regulatory releases be sent south from Lake Okeechobee towards the WCAs.

2008 LORS Release Guidance (Part D): With Lake Okeechobee stage in the Low Sub-band, the Tributary Hydrologic Conditions in the Normal category, the Seasonal Lake Okeechobee Net Inflow outlook in the Very Wet category, and the Multi-seasonal Lake Okeechobee Net Inflow Outlook in the Normal category, Part D of the 2008 LORS suggests “S-79 up to 450 cfs and S-80 up to 200 cfs”. In addition, Lake Okeechobee stage is 0.62 feet above elevation 11.28 feet NAVD88 (12.88 feet NGVD29) which is the stage for the upper boundary of the Ecological Envelope for this time of the year.

For the two 7-day period, June 24 to June 30, 2024 and July 1 to July 7, 2024, total discharge to the St. Lucie Estuary was about 1,300 cfs and 1,800 cfs over the past two 7-day periods, with no flows coming from Lake Okeechobee during either period. The 7-day average salinity in the middle estuary was within the optimal range (10- 25) for adult eastern oysters for both periods. Total inflow to the Caloosahatchee Estuary averaged approximately 5,350 cfs and 5,000 cfs over the past two 7-day periods with about 150 cfs and 400 cfs coming from Lake Okeechobee through S-77 during the two periods, respectively. Salinities were in the damaging range (< 5) for adult eastern oysters at Cape Coral, in the optimal range (10-25) at Shell Point and in the upper stressed range (> 25) at Sanibel for both periods.

The District will continue to work with the USACE to manage Lake Okeechobee levels in an effort to curtail harmful discharges over this year. To help with this objective the District will move as much water south through the Stormwater Treatment Areas as possible under the current permits and as regional conditions allow. The District recommends USACE implements a non-harmful release from Lake Okeechobee to the Caloosahatchee Estuary with an average discharge of 2,000 cfs (7-day pulse) as measured at the S-79 structure, zero lake releases to the St. Lucie Estuary and zero lake releases to the Lake Worth Lagoon. The USACE should continue to track Red Tide and Blue Green Algae conditions, and should

conditions change during this operational period, the USACE should look to reassess releases as needed. The USACE typically implements the releases to the estuaries over a 7-day period starting on Saturday and ending on Friday.
