

MEMORANDUM

TO: Lauren Borocharner, Chief, Engineering Division (USACE)
FROM: John Mitnik, Chief District Engineer (SFWMD)
Akin Owosina, Chief, Hydrology & Hydraulics Bureau (SFWMD)
DATE: September 30, 2021
SUBJECT: Operational Position Statement for September 28, 2021 to October 4, 2021

This Position Statement is to provide operational recommendations for the one-week period from September 28, 2021 to October 4, 2021 based on system conditions and data observed during the previous Monday to Sunday 7-day period. On September 27, Lake Okeechobee stage was 15.44 feet NGVD, which places it within the Low Sub-band of the 2008 Lake Okeechobee Regulation Schedule (LORS). Lake stage increased by 0.39 feet during the preceding 7 days.

September District rainfall to date is above normal (117% of normal). Rainfall forecast (issued September 28) predicts well below normal rainfall for the coming 7-day period and near normal rainfall for the second 7-day period.

Precipitation Outlook: The most recent CPC precipitation outlooks for October 2021 is for equal chances of below, normal and above-normal rainfall. The precipitation outlook for the 3-month window of Oct-Dec is for slightly decreased chances of below-normal rainfall. The 3-month windows of Nov 2021-Jan 2022 to Feb 2022-Apr 2022 indicate increased chances of below-normal rainfall. The outlooks for the 3-month windows transitioning and into the 2022 wet season are for increased chances of above-normal rainfall, after an outlook of equal chances for the 3-month window of Mar 2022-May 2022.

2008 LORS Release Guidance (Part C): With Lake Okeechobee stage within the Low Sub-band, the Tributary Hydrologic Conditions in the Very Wet category and the Multi-seasonal Lake Okeechobee Net Inflow Outlook in the Normal category, Part C of the 2008 LORS suggests "Up to Maximum Practicable to the WCAs if desirable or with minimum Everglades impact; otherwise no releases to WCAs".

Over the 7-day period from September 20, 2021 to September 26, 2021, no Lake Okeechobee releases were directed to the STAs. No Lake regulatory releases reached the Lake Worth Lagoon through the C-51 canal. Stage in WCA-1 is below regulation schedule in Zone A2, stage in WCA-2A is above schedule, and WCA-3A stage is above schedule (Zone A). For the coming operational period, the USACE is requesting maximum practical regulatory releases be sent south from Lake Okeechobee towards the WCAs.

2008 LORS Release Guidance (Part D): With Lake Okeechobee stage in the Low Sub-band, the Tributary Hydrologic Conditions in the Very Wet category, Lake stage within 1 ft of the Intermediate Sub-band, and the Seasonal Lake Okeechobee Net Inflow Outlook in the Normal category, Part D of the 2008 LORS suggests "S-79 up to 3,000 cfs and S-80 up to 1,170 cfs".

For the 7-day period September 20, 2021 to September 26, 2021, total discharge to the St. Lucie Estuary was near 2,800 cfs with no flows coming from Lake Okeechobee. The 7-day average salinity at the US1 Bridge is in the fair range for adult oysters. Total inflow to the Caloosahatchee Estuary averaged approximately 10,600 cfs over the past week with no discharges coming from Lake Okeechobee. Salinity conditions are in the good range for Tape Grass at Val I-75 and at Ft. Myers. Salinity conditions for adult eastern oysters are in the good range at Shell Point and Sanibel locations, and in the poor range at Cape Coral.

The District will continue to work with the USACE to manage Lake Okeechobee levels in an effort to curtail harmful discharges over this year. Generally speaking, the District and Corps should strive to move as much water out of the lake without harming natural resources and other critical resources. At this time, this involves releases that maintain appropriate salinity in the estuaries and ensuring the Stormwater Treatment Areas don't sustain long term damage from extended high-volume flows. Current District operational objectives are to continue to move water south from Lake Okeechobee for delivery to the Everglades where opportunities exist.

The District recommends USACE continue lake discharges to the Caloosahatchee Estuary in a pulse release fashion, measured at S-79, at a non-damaging level between 1,000 and 2,000 cfs (7-day average), while continuing to monitor estuary conditions and make any adjustments as necessary. This decision should be reassessed as needed based on lake and estuarine conditions. The USACE typically implements the releases to the estuaries over a 7-day period starting on Saturday and ending on Friday.
